

## Urea

### Test principle: Kinetic UV test

Kinetic test with urease and glutamate dehydrogenase. Urea is hydrolyzed by urease to form ammonium and carbonate. In the second reaction,  $\alpha$ -ketoglutarate reacts with ammonium in the presence of glutamate dehydrogenase (GIDH) and the coenzyme NADH to produce L-glutamate. In this reaction, two moles of NADH are oxidized to NAD for each mole of urea hydrolyzed.

The rate of decrease in the NADH concentration is directly proportional to the urea concentration in the sample. It is determined by measuring the absorbance at 340 nm.
